

A Company Profile

Introduction

Knowledgeone Corporation began life as GMB Solutions Pty Limited in August 1983, commencing commercial operations in April 1984. The Company name GMB came from the initials of the three original partners being **G**illett, **M**ckenna and **B**achmann. Mr Frank McKenna is the founder and is now the only one of the original three still involved with the company.

Frank is the Managing Director and CEO of the Australian Company and the President and CEO of the US Company. GMB Research & Development Pty Ltd was renamed as Knowledgeone Corporation in August 2005.

What do we do?

K1Corp designs, builds, installs and supports a range of innovative knowledge management and enterprise (ECM) software applications. Our products apply to a wide range of applications areas such as records management, electronic document management, imaging and workflow. In the last 25 years K1Corp has brought 27 new products to market.

Cross Industry Products

K1Corp's products are installed in organizations in virtually every industry segment. We supply solutions to local government, federal government, defense, health, law enforcement, education, manufacturing, distribution, utilities, banking and finance.

There is no industry where our products don't fit and add value.

Solution Oriented Company

K1Corp has been producing information management products since the first DocFind in 1984. Today we are Australia's leading software innovator and have set industry standards for many years in information management, records management, image management, EDRMS, ECM and knowledge management solutions.

With the release of Knowledgeone (K1) in 2005, we introduced the world to a totally new genre of information management product; one that totally empowered the customer. With RecFind 6 we have taken this to the next level and it is now even easier for the customer to quickly and easily change both the Data Model and Business Processes using the high level tool (the DRM) that comes free with RecFind 6.

In addition, RecFind comes preconfigured 'out-of-the-box' with a number of ready-to-run applications including records management, document management, imaging, workflow, asset management, human resources management and customer relationship management. It can also run multiple applications concurrently and is also dynamically multilingual – able to support multiple languages concurrently.

RecFind also includes two optional add-ons in its suite of tools (GEM and RecCapture) that facilitate implementation of a fully automatic, rules-driven EDRMS. Both GEM and RecCapture are innovative new products incorporating a server-centric (no software to install on workstations), rules driven (expert system) and fully automatic (there is nothing for the user to do) paradigm for the selection, capture and classification of electronic documents and emails.

Products

- RecFind 6, the fully integrated EDRMS, includes all required EDRMS functionality - no additional modules required.
- RecFind 6 DRM - Administrator's tool to change any aspect of RecFind 6.
- RecFind 6 Xchange - capture data from any source and integrate to any product.
- RecFind 6 Button - the world's easiest to use EDRMS tool for check-in, check-out, searching and scanning.
- RecFind 6 High Speed Scanning Module (HSSM) - totally automates high volume scanning jobs.
- RecFind 6 Mini API - allows any other product to use RecFind 6 as its document and image library.
- RecFind 6 GEM - fully automatic email management and archiving.
- RecFind 6 RecCapture - fully automatic EDRMS.

Technology

K1Corp employs a variety of tools and technologies to build its products and provide solutions to its clients. In building products we use VB.NET, ASP.NET, C++, Java, HTML, XML etc. We use the most appropriate tool for the job. The architecture of RecFind 6 is based on the .NET 2008 smart client paradigm. This means a rich windows client that works equally well over the LAN or Internet without the need for a browser.

Integration

We have integrated to a host of 'foreign' products and application systems over the years. RecFind 6 comes with a free integration tool called Xchange that can connect to any application, database or data source and extract and capture data into the RecFind 6 repository. There literally isn't any product or system we can't integrate to.

Development Partnerships

We have ongoing relationships with most major vendors and specific development partnerships with Microsoft, IBM/ Lotus and Novell. These partnerships are extremely important because they allow us to be knowledgeable and experienced in the latest releases, technologies, databases and operation systems. We have for example, been a member of the Microsoft MSDN program since its inception.

Why deal with Knowledgeone Corporation?

- K1Corp has 25 years experience in designing, developing, installing and supporting information management solutions.
- K1Corp has the robust, scalable and proven products that meet your management needs and significantly reduce the costs and risks associated with major EDRMS rollouts.
- K1Corp has all the services you will need to deliver and support your solution.
